create infrastructure with terraform

"Building Infrastructure with Terraform - A Step-by-Step Guide"

Script: Hello everyone! Today we are going to talk about how to build infrastructure with Terraform, while leveraging the power of Terraform's open-source software and configuration language, HashiCorp Configuration Language (HCL).

We'll take a deep dive into the basics of Terraforming, a process that makes a planet's atmosphere, temperature, surface topography, and ecology similar to Earth's, making it habitable for humans. We will explore the various proposals by Carl Sagan, dated 1961, and Jack Williamson's concept of a science-fiction short story ("Collision Orbit"), published in 1942.

Additionally, we will discuss the feasibility of creating an unconstrained planetary environment on other planets like Mars and Venus, as well as the economic attitude of preferring short-term profits over long-term investments and the long timescales and practicality of terraforming.

Finally, we will touch on Terra, a blockchain protocol and payment platform used for algorithmic stablecoins. We will take a look at the Terra stablecoin and Luna reserve asset cryptocurrency, as well as the collapse of TerraUSD (UST) and Luna that wiped out almost \$45 billion in market capitalization within a week.

Wikipedia Research

Page: Terraform (software) Summary: Terraform is an open-source infrastructure-as-code software tool created by HashiCorp. Users define and provide data center infrastructure using a declarative configuration language known as HashiCorp Configuration Language (HCL), or optionally JSON.

Page: Terraforming Summary: Terraforming or terraformation ("Earth-shaping") is the hypothetical process of deliberately modifying the atmosphere, temperature, surface topography or ecology of a planet, moon, or other body to be similar to the environment of Earth to make it habitable for humans to live on. The concept of terraforming developed from both science fiction and actual science. Carl Sagan, an astronomer, proposed the planetary engineering of Venus in 1961, which is considered one of the first accounts of the concept. The term was coined by Jack Williamson in a science-fiction short story ("Collision Orbit") published

in 1942 in Astounding Science Fiction, although terraforming in popular culture may predate this work. Even if the environment of a planet could be altered deliberately, the feasibility of creating an unconstrained planetary environment that mimics Earth on another planet has yet to be verified. While Venus, Earth, Mars, and even the Moon have been studied in relation to the subject, Mars is usually considered to be the most likely candidate for terraforming. Much study has been done concerning the possibility of heating the planet and altering its atmosphere, and NASA has even hosted debates on the subject. Several potential methods for the terraforming of Mars may be within humanity's technological capabilities, but according to Martin Beech, the economic attitude of preferring short-term profits over long-term investments will not support a terraforming project. The long timescales and practicality of terraforming are also the subject of debate. As the subject has gained traction, research has expanded to other possibilities including biological terraforming, para-terraforming, and modifying humans to better suit the environments of planets and moons. Despite this, questions still remain in areas relating to the ethics, logistics, economics, politics, and methodology of altering the environment of an extraterrestrial world, presenting issues to the implementation of the concept.

Page: Terra (blockchain) Summary: Terra is a blockchain protocol and payment platform used for algorithmic stablecoins. The project was created in 2018 by Terraform Labs, a startup co-founded by Do Kwon and Daniel Shin. It is most known for its Terra stablecoin and the associated Luna reserve asset cryptocurrency. In May 2022, the Terra blockchain was temporarily halted after the collapse of the stablecoin TerraUSD (UST) and Luna, in an event that wiped out almost \$45 billion in market capitalisation within a week.
